

Business Analysis Answers

1. Customer Behavior

Customers C001, C002, C003, C004, C007, and C010 are the most active users with multiple completed rides. These customers appear to be regular users and should be targeted through loyalty programs and personalized offers

2. Frequent Cancellations

Several customers have cancellation rates above 50%, with some reaching 100%. This may indicate:

- Long waiting times
- Driver unavailability
- Price concerns
- Booking made for comparison purposes

The company should investigate these users' experiences

3. Peak Booking Day

Tuesday recorded the highest bookings. Extra drivers should be scheduled on Tuesdays and demand forecasting should account for this trend

4. Driver Performance

Drivers with ratings around 3 or below require:

- Customer service training
- Driving quality monitoring
- Periodic performance reviews

5. Long Distance Drivers

Driver17 and Driver14 handled the longest trips. These drivers may be more willing to accept long-distance rides and can be prioritized for premium or intercity services

6. Driver Reliability

Drivers D015, D003, D004, D008 and D009 show very high cancellation rates and may require investigation. High driver cancellation negatively impacts customer satisfaction.

7. Revenue Trend

Completed trips generated **₹1,677.50** revenue. While the dataset is small, consistent monitoring of monthly trends can identify seasonal demand patterns.

8. Popular Routes

Most travel occurs between:

- Aundh → Viman Nagar
- Aundh → Kharadi
- Kharadi → Viman Nagar

More vehicles should be positioned near these locations

9. Rating vs Earnings

Higher-rated drivers generally show higher earnings and completed trip counts.

Example:

- Driver17 Rating = 4.0, Earnings = ₹964.20
- Driver11 Rating = 4.5, Earnings = ₹433.20

There is a positive relationship, although the sample is small.

10. Cancellation Reasons

The main recorded cancellation reason is: **"Too much wait time"**

Recommendation:

- Improve dispatch algorithms
- Increase cab density at busy locations
- Provide accurate ETA estimates

11. Short Trip Contribution

Short trips contribute only **6.46%** of revenue while long trips contribute **84.73%**. Business growth should focus on long-distance bookings while maintaining short rides for customer acquisition.

12. Vehicle Type Performance

SUVs generate over twice the revenue of Sedans.

Recommendation:

- Expand SUV fleet
- Prioritize SUV allocation during peak periods

13. Churn Risk Customers

Customers C012 and C017 are at highest churn risk, with nearly 690 days since their last booking and only one ride each. These customers should receive retention offers and re-engagement campaigns

14. Weekday vs Weekend Demand

Weekdays generate:

- More rides
- More total revenue

Weekend average fare is higher, suggesting demand-based pricing could be effective. Dynamic pricing may increase profitability during weekends and other high-demand periods.
